A 32-year-old Man Presented with Cognitive Impairment

Piroon Mootsikapun, M.D.
Division of Infectious Diseases, Department of Medicine, Faculty of Medicine, Srinagarind Hospital, Khon Kaen, Thailand.

A 32-year-old man presented with progressive forgetfulness, difficulty to walk, and slow speech for 2 months. Physical examination revealed normal vital signs, oral hairy leukoplakia and pruritic popular eruptions. Neurological examination showed decreased cognition, abnormal conjugate gazes, and increased jerk reflexes. Computerized tomography scan of the brain was performed and the results are shown in Figures. Anti-HIV antibody was positive.

What is your diagnosis?

Figures.
